

Lartisan Style Guide

Version 1.0 | 29 May 2026

A practical visual system for trusted local-service marketplace operations across customers, artisans, field agents, LGA admins, state coordinators, finance teams, and support operators.

Palette source: Leadprenuer homepage brand variables. Base colors: #001c72, #61ce70, #6c757d, and #1d1d1d, with accessible Lartisan neutrals and status colors derived around them.

Design intent

Lartisan should feel trustworthy, local, premium, and operationally competent. The product serves marketplace discovery and field operations, so the interface balances warmth with dashboard clarity.

- Verified local skill.
- Clear accountability.
- Practical field operations.
- Financial trust.
- Calm, fast decision-making.

1. Brand Position

The design language helps customers make confident hiring decisions while giving operations teams dense, legible control surfaces for KYC, bookings, payments, payouts, disputes, and support.

2. Color System

The base palette is derived from Leadprenuer colors found on leadprenuer.com.ng. Blue anchors trust and navigation, green confirms verified success, gray supports secondary work, and ink keeps dense operational data readable.

Token	Hex	Usage
Leadprenuer Blue	#001c72	Primary actions, navigation, key dashboard anchors, trust-heavy headers.
Growth Green	#61ce70	Verified states, successful payments, completed KYC, healthy metrics.
Operational Gray	#6c757d	Secondary buttons, muted labels, helper text, metadata.
Ink	#1d1d1d	Primary text and dense operational data.
Field Amber	#f59e0b	Pending KYC, payout review, retries, caution states.
Risk Red	#dc2626	Failed payments, rejected KYC, suspensions, destructive actions.
Surface	#f8fafc	App background and quiet work surfaces.
Border	#d8dee8	Dividers, cards, tables, input boundaries.

Usage Rules

- Use blue for primary commitments: create booking, approve profile, save policy, process payout.
- Use green only when the state is genuinely successful or verified.
- Use amber for waiting, review, retry, or needs-attention states.
- Use red only for destructive, failed, rejected, or high-risk states.
- Avoid pages dominated by blue. Pair blue with white, green, gray, amber, and restrained red.
- Keep dark mode readable: green becomes the primary action color on very dark blue backgrounds.

3. Typography

Use Instrument Sans in the application UI. In the PDF, the same proportions are approximated with a clean sans-serif stack. The system supports product pages and dense operational dashboards.

Style	Usage
Page title	Main screen identity, one per page.
Section heading	Form sections, dashboard groups, admin modules.
Body text	Descriptions, instructions, support copy.
Label	Inputs, filters, table metadata.
Code / ID	References, transaction IDs, payout references, webhook IDs.

- Keep headings plain and descriptive.
- Prefer short labels over clever copy.
- Use sentence case for UI text.

- Use active verbs in actions: Approve, Assign, Review, Suspend, Retry.
- Do not use hero-size type inside dashboard panels or settings forms.

4. Layout Principles

Customer Surfaces

Customer discovery may be more visual and inviting. It should still show trust signals early:

- Verified artisans.
- Location match.
- Rating and completed jobs.
- Starting price.
- Availability.
- Clear next action.

Operations Surfaces

Admin, LGA, state, and agent screens should be dense but organized:

- Tables for queues and finance records.
- Filters for state, LGA, area, status, owner, and date.
- Cards only for summary metrics or repeated records.
- No nested cards.
- Keep page sections unframed unless the user is acting inside a specific tool or list item.

Mobile

Field-agent workflows must work cleanly on mobile:

- Large touch targets.
- Single-column forms.
- Persistent action area for save or submit where useful.
- Upload progress and retry states.
- Clear offline or failed-upload messaging.

5. Components

Buttons

Button	Usage
Primary	Main action on a screen or modal.
Secondary	Useful but lower-priority action.
Outline	Navigation, evidence viewing, non-committal actions.
Destructive	Suspend, delete, reject, cancel payout, close with penalty.

Use icons for recognizable tools and status actions when available through lucide-vue-next.

Badges

Badges should represent stable state, not decorative emphasis.

Approved / verified / completed / paid	Green
Pending / queued / in review	Amber or neutral
Escalated / needs evidence	Orange or amber
Rejected / failed / suspended	Red
Draft / inactive / archived	Gray

Tables

Operational tables should include:

- Human-readable name.
- Scope: state, LGA, area, or owner.
- Status.
- Last activity.
- Next action.
- Risk or priority where relevant.

Forms

Forms should:

- Use clear labels and helper text only when it prevents mistakes.
- Group related fields.
- Show validation near the field.
- Preserve uploaded media state.
- Confirm destructive or irreversible decisions.

6. Status Language

Use consistent verbs and status names across customer, artisan, and admin views. Status labels should match backend enum vocabulary wherever practical.

Avoid	Prefer
Done	Completed
OK	Approved
Bad	Rejected
Waiting	Pending
Problem	Escalated
Money sent	Paid

7. Accessibility

- Primary blue buttons require white text.
- Green backgrounds need dark text unless used as a small badge on dark surfaces.
- Do not rely on color alone for status; pair with text and icons.
- Maintain visible focus states through the existing ring token.
- Keep touch targets at least 40px where possible.

- Make dynamic content announcements available for critical payment, KYC, and upload state changes.

8. Live Style Guide

The live style guide is available inside authenticated settings at:

</settings/style-guide>

It demonstrates color roles, typography voice, journey cards, status badges, and action hierarchy. The live page should evolve as the production component set grows.

Implementation note: this PDF mirrors docs/Lartisan_Style_Guide.md and the authenticated Inertia page at settings/style-guide. When the component set expands, update the markdown and regenerate this artifact.
